

Perennial Ryegrass Forage Value List

Upper Sth. Island

Cultivars are sorted by star rating and then alphabetically. Note:

- Perennial ryegrass FVI is calculated using cultivar specific seasonal DM (DM) data, functional group average metabolisable energy (ME) content data and ploidy group average persistence trait data.
- Cultivars with SE are not recommended as they can cause ryegrass staggers in summer and may reduce milksolid production at this time.

Dairynz[®]
Forage Value Index

Evaluation date: Feb 2019

Filtered by: UPPER SOUTH ISLAND, PERENNIAL RYEGRASS/AR1/AR37/ENDO5/LE/NEA2/SE/WE/NEA/EDGE/UNKNOWN, DIPLOID/TETRAPLOID, MID/LATE/VERY LATE

¹5 = Top rank, 1 = bottom rank, ²Winter = Winter dry matter production (June-July), ³Early Spring = Early spring dry matter production (Aug-Sept), ⁴Late Spring = Late spring dry matter production (Oct-Nov), ⁵Summer = Summer dry matter production (Dec-Feb), ⁶Autumn = Autumn dry matter production (Mar-May), ⁷Performance values for ME content are based on average values for the mid heading diploids, late heading diploids, and tetraploid functional group, ⁸Persistence scaling factor (scales 3 year trial data by expected yield over a 10-year period for diploids versus tetraploids), ⁹Relative renewal cost (relative renewal costs of diploids versus tetraploids, taking into account differences in relative persistence over the long term and costs of renewal), ¹⁰Endophyte, ¹¹Ploidy (D=diploid, T=tetraploid), ¹²Heading date (MS=mid season, L=late, VL=very late), ¹³Confidence (based on number of DM trials in the regions weighted by the DM trait correlations). For more information visit www.dairynz.co.nz/fvi.

Cultivars included in the FVI lists without a star rating have enough trials to be eligible for the FVI, however they were excluded from the FVI Star Ratings due to poor performance in those trials.
