Introduction

The 2021-22 DairyNZ Economic Survey is the seventeenth annual survey of New Zealand dairy farmers using dairy farm business data from DairyBase®.

The Economic Survey of Factory Supply Dairy Farmers was first published in 1963-64 by the New Zealand Dairy Board. In 1988-89 the survey was undertaken by Livestock Improvement Corporation (LIC) and then Dexcel in 1999-2000, when the name was changed to Economic Survey of New Zealand Dairy Farmers. From 2005-06 DairyNZ published the survey under the new title DairyNZ Economic Survey.

DairyNZ is the industry good organisation, representing New Zealand's dairy farmers. Funded by a levy on milksolids and together with government investment, our purpose is to deliver a better future for New Zealand dairy farmers and help them successfully navigate through change. We aim to do this by leading innovation in world-class dairy farming and by working always in the best interests of New Zealand's dairy farmers. DairyBase® is owned and managed by DairyNZ on behalf of the dairy farmers of New Zealand.

June 2023 - Original release

Executive Summary

Milk payout received by farmers in 2021-22 increased by \$1.79 to \$9.19 per kilogram of milksolids (MS). Compared to the 2020-21 season, milksolids production per cow and per hectare decreased slightly, operating expenses per kilogram of milksolids increased by \$1.03 to \$6.35, operating profit per hectare increased by \$955 to \$4,150, operating return on dairy assets increased from 6.1 percent to 7.6 percent and total return on assets increased by 2.7 percentage points to 7.5 percent. Total return on equity increased to 11.5 percent (from 6.4 percent), driven by high returns from dairy operations.

Owner-operator Summary

Operating profit of \$4,150 per hectare in 2021-22 was up 30 percent on the previous season. The milk payout received of \$9.19 per kilogram of milksolids was up \$1.79 (+24%) on the price received in 2020-21. Milksolids sold per cow and milksolids sold per hectare both decreased by 1.9 percent in 2021-22. Livestock income per kilogram of milksolids increased by 6 cents to \$0.55. Gross farm revenue of \$9.81 per kilogram of milksolids was up \$1.87 in 2021-22. Farm working expenses of \$5.32 per kilogram of milksolids were \$0.89 higher compared with last season. Operating expenses increased \$1.03 to \$6.35 per kilogram of milksolids, setting a new record high.

Cash available for living and growth in 2021-22 was \$427,950 per farm, breaking the record ten year high set last season. Following high levels of capital expenditure (\$267,306), net debt (\$43,029) and drawings (\$114,873), an average cash surplus of \$2,543 per farm was recorded. The operating return on dairy assets increased to 7.6 percent and the total return on assets was 7.5 percent. Total return on equity was 11.5 percent, 5.1 percentage points higher than in the previous season. Equity growth was positive, increasing by \$194,675 to \$362,987. Total liabilities as a percentage of total assets (debt to asset ratio) decreased to 47.4 percent at the end of the season, but Closing term liabilities per kilogram of milksolids increased from \$22.37 to \$23.56.

Owner-operator Summary Table

| Growth in equity | 168,312 | 362,987 |
| Growth in equity from profit | 208,237 | 297,876 |
| Growth in equity from capital | -39,822 | 65,148 |
| Growth in equity % | 4.4% | 8.3% |
| RISK: | | |
| Closing debt to asset % | 50.1% | 47.4% |
| Closing term liabilities per kg MS | 22.37 | 23.56 |

50:50 Sharemilkers Summary

Dairy operating profit per hectare for 50:50 sharemilkers (herd owning sharemilkers) recorded an increase (+37%) to \$1,764 per hectare in 2021-22. Higher milk payouts received (+\$0.89 per kilogram of milksolids) were partially offset by a decrease in milksolids per cow (-23 kg MS) and a slight reduction in herd size. Gross farm revenue of \$5.05 per kilogram of milksolids was up \$0.93 in 2021-22. Farm working expenses of \$2.86 per kilogram of milksolids were 38 cents higher than last season. Operating expenses per kilogram of milksolids increased by 48 cents in 2021-22 to \$3.61.

The cash available for living and growth in 2021-22 for 50:50 Sharemilkers was \$249,488 per farm, 3.4 percent lower than the previous season. Capital expenditure was lower in 2021-22, but combined with increases in net debt and drawings resulted in a cash operating surplus of \$38,556 per farm, 35 percent lower than the previous season. The operating return on dairy assets increased to 26.9 percent, while the total return on equity was 42.5 percent, 20 percentage points higher than in 2020-21. High equity growth from profit was complemented by positive growth in equity from capital. Total liabilities as a percentage of total assets (debt to asset ratio) decreased to 36.5 percent. Closing term liabilities per kilogram of milksolids decreased to \$2.67.

50:50 Sharemilkers Summary Table

Table 2

| | 2020-21 | 2021-22 |

1 Background

The 2021-22 DairyNZ Economic Survey summarises a sample of dairy farm data from the DairyBase® database. DairyBase® is available to all levy-paying New Zealand dairy farmers. Annual surveys before 2005-06 were conducted by the Livestock Improvement Corporation (LIC) and Dexcel using a random sampling procedure stratified by region and herd size. In contrast, participation in DairyBase® is voluntary and, at this stage, contains farms with above-average milk production levels. For this publication, groups of farms were selected to match the average regional herd size, hectares and milksolids production as published in the New Zealand Dairy Statistics 2021-22 as close as possible while maintaining a large sample size.

The purpose of DairyBase® is to improve the financial understanding and performance of dairy farmers using a benchmarking approach and is designed to link the physical and financial performance of farms. DairyBase® contains financial data from annual farm accounts and physical data supplied by the farmer, and estimated current market values of fixed assets. The DairyBase® support centre, accredited accountants and other rural professionals enter the data on behalf of their clients, and it is validated within DairyBase®. Farmers wishing to benchmark their farm performance have access to a wide range of statistics in DairyBase®, including (where numbers permit) regional, district and production system data.

2 Survey Description

2.1 Survey Methodology

Groups of farms were selected to match the average regional herd size, hectares and milksolids production as published in the New Zealand Dairy Statistics 2021-22 as close as possible while maintaining a large sample size. The initial pool of farms included 784 owner-operators and 220 50:50 sharemilkers (herd owning sharemilkers) with data validated and committed to the DairyBase® database for the 2021-22 financial year. This excluded:

- · multiple herds operating under one business identity, and/or
- herds with fewer than 50 cows.

Businesses were then excluded for the following reasons:

- businesses with a significant change in the land area during the year, and/or
- extreme outlier data and/or
- · key financial data required for the data sample were missing.

The sample selection process aimed to align the regional and national average herd sizes, hectares and milksolids production for each of these two ownership structures while retaining a reasonable number of farm businesses. These regional and national averages are available in New Zealand Dairy Statistics 2021-22 publication.

The final number of herds included in this survey comprised 255 owner-operators and 87 50:50 sharemilker herds. Of the owner-operator herds, 185 (72.5%) were North Island herds, and 70 (27.5%) were from the South Island. Of the sharemilker herds, 64 (73.6%) were from the North Island, and 23 (26.4%) were South Island herds.

2.2 Ownership Structure Definitions

An owner-operator receives 100 percent of the milk revenue and either owns, or leases, both the herd and the land. In contrast, a 50:50 sharemilker owns the herd but not the milking land, and receives 50 percent of the milk revenue. Although the definition of sharemilkers used in this survey is 50:50, in practice, they may receive between 40 percent and 60 percent of the milk revenue. Herds with variable order sharemilkers, and farm owners with sharemilking arrangements, were not included in this survey.

2.3 Sample Unit

The data used in this survey reflects the total dairying enterprise of each business. Where businesses have multiple ownership types, such as partnerships and trusts, the accounts of all entities are consolidated and entered as one.

2.4 Survey Weights

All national averages in this report have been weighted by the regional proportion of herds reported in the New Zealand Dairy Statistics 2021-22 (Table 2.1). Simply averaging the regional data shown in this document does not produce the same national average. Weighting the data ensures that each region contributes a representative proportion to the national averages. The national averages for 50:50 sharemilkers are weighted by the regional proportion of sharemilkers.

Table 2.1: Regional Distribution of Herds: Dairy Statistics

| Region | Owner-operator herds | % of Owner-operator herds | 50:50 Sharemilker herds | % of 50:50 Sharemilker herds |
|-------------------------------|-------------------------|---------------------------------|-------------------------------|------------------------------------|
| Northland | 471 | 8.3% | 176 | 5.9% |
| Waikato | 1,776 | 31.1% | 1,118 | 37.8% |
| Bay of Plenty | 307 | 5.4% | 150 | 5.1% |
| Taranaki | 836 | 14.7% | 465 | 15.7% |
| Lower North Island | 599 | 10.5% | 205 | 6.9% |
| West Coast - Top of the South | 299 | 5.2% | 85 | 2.9% |
| Canterbury | 688 | 12.1% | 327 | 11.0% |
| Otago - Southland | 728 | 12.8% | 435 | 14.7% |
| Total New Zealand | 5,704 | 100.0% | 2,961 | 100.0% |

2.5 Herd Size Distributions

The average owner-operator herd in the Economic Survey had 419 cows, an increase of 11 relative to the 2020-21 season. In comparison to the New Zealand Dairy Statistics 2021-22 national average herd size of 441, the average Economic Survey farm had 22 cows less.

A comparison of the owner-operator herd distribution between the DairyNZ Economic Survey and the New Zealand Dairy Statistics 2021-22 shows the DairyNZ survey:

- is over-represented by herds between 200 and 600 cows;
- is under-represented by herds with less than 200 cows, by herds between 700 and 1100 cows, and by herds with 1200+ cows.

Refer to Figure 2.1.

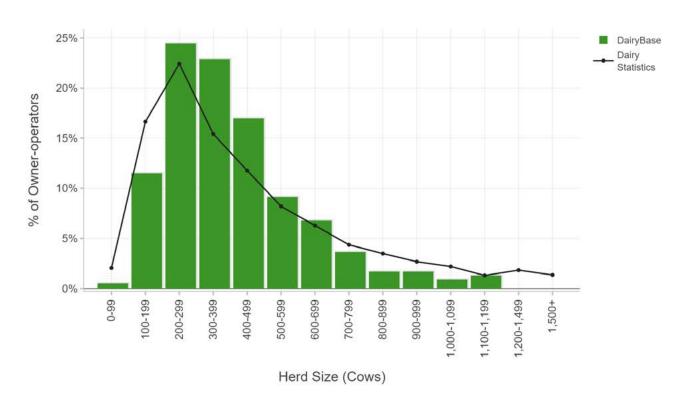

Figure 2.1: New Zealand Owner-operator Herd Size Distributions 2021-22

The DairyNZ Economic Survey national average herd size for 50:50 sharemilkers of 424 cows is larger than the 422 cows recorded in the New Zealand Dairy Statistics 2021-22.

As compared with the New Zealand Dairy Statistics 2021-22, for 50:50 sharemilkers, the DairyNZ Economic Survey:

- excludes herds under 100 cows, herds between 900 and 1000 cows, herds betwee 1,100 and 1,200 cows, and herds with more than 1,500 cows;
- is over-represented by herds between 200 and 600 cows;
- is under-represented by herds between 700 and 900 cows.

Refer to Figure 2.2.

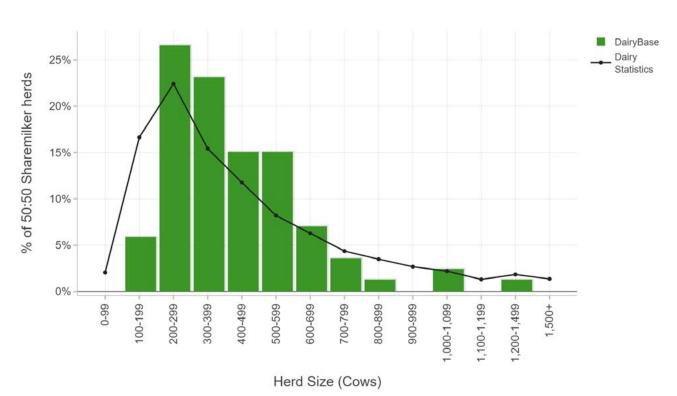

Figure 2.2: New Zealand 50:50 Sharemilker Herd Size Distributions 2021-22

2.6 Survey Regions

This survey uses geographic regions and districts as defined by the 73 Territorial Local Authorities (TLAs). These districts are amalgamated into eight regions, five in the North Island and three in the South Island. Regions 6 and 7, and the TLAs included in them were updated for the 2021-22 Economic Survey, to reflect similar changes in DairyBase®. For regions 6 and 7, part of the difference in values between the 2021-22 season and previous seasons (sections 7.1 and 10.1) is due to the rearrangement of the TLAs that were part of them.

2.7 Production Systems

Farms are categorised into one of five production systems based on the timing, purpose and amount of imported feed used, both purchased as supplements and grazing off for dry cows. Young stock grazing policies are excluded when categorising herds into the five production systems described below.

System 1: All grass, self-contained, all adult stock on the dairy platform

• No feed is imported. No supplement is fed unless harvested off the effective milking area, and dry cows are not grazed off the effective milking area.

System 2: Feed imported, either supplement or grazing off, fed to dry cows

• 90-99 percent of total feed is home grown feed. Variation in percentage as most cows are wintered off in high rainfall areas or cold climates.

System 3: Feed imported to extend lactation and for dry cows

• 80-89 percent of total feed is home grown feed.

System 4: Feed imported and used at both ends of lactation and for dry cows

• 70-79 percent of total feed is home grown feed.

System 5: Imported feed used all year

• 50-69 percent of total feed is home grown feed, though it could be less than 50 percent in some cases. Approximately 6 percent of owner-operator herds.

This publication refers to low, medium and high input systems. These are defined as:

• Low: system 1 and system 2,

• Medium: system 3,

• High: system 4 and system 5.

2.8 Operating Profit Adjustments

Non-cash adjustments for resources used but not accounted for by cash income or expenditure are made when calculating the operating profit. A summary of these adjustments is shown below. For more detail, refer to the DairyBase® Operating Profit Adjustments document. An example of non-cash adjustments is the value of change in dairy livestock, which is calculated and added to net dairy cash income to form gross farm revenue. Note: this is the value due to a change in livestock numbers. This adjustment is because the revenue from net dairy cash income can be affected by changes in herd size. For example, in drought years, more stock are sold and therefore, revenue through net livestock sales will be considerably higher. Similarly, livestock will be purchased in years following a drought to increase numbers to a more normal level. The adjustment offsets these changes with a value for change in livestock on hand.

- The value of change in dairy livestock is calculated as follows: closing livestock numbers less opening livestock numbers, valued at closing herd scheme values (Inland Revenue).
- **Labour adjustment** comprising two components: unpaid management based on the size of the herd and time worked, and unpaid labour valued at an hourly market rate.
- **Feed inventory adjustment** closing supplementary feed on hand less opening supplementary feed on hand, valued at a standard 35 cents per kilogram dry matter in 2021-22.
- **Owned support block adjustment** valued based on regional market lease rate per hectare.
- **Depreciation** as recorded in the annual financial statements of the farm.

2.9 Asset Values

DairyBase® calculates market values for land and buildings by using the most recent rateable valuations for each farm and adjusting these to 1 June 2020 and 1 June 2021 market values using sales data supplied by Quotable Value and REINZ plus discussions with regional real estate agents and valuers. Opening and closing livestock values for each year are calculated using the Inland Revenue herd value scheme NAMV (National Average Market Values) for the appropriate age group of animals.

Plant, machinery and vehicle values are recorded at book value.

Off-farm assets and investments are shown as market values.

2.10 **GST**

The financial data is GST exclusive as these transactions are neutral to the farm operation.

2.11 Statistical Methodology

Multiple methodologies are used in the Economic Farm Survey to generate statistics. **Tables and graphs** that use time series data are generated using an average of sums methodology. The average of sums involves summing all values together. While per farm values will be equivalent to the arithmetic mean, values that are divided by the number of cows, hectares, and milksolids will report the average value divided by the average denominator.

The average of sums approach ensures that table entries add up to totals / sub-totals. However, a consequence of this methodology is that the averages reported are not equivalent to the arithmetic mean and can be biased depending on the data distribution. This bias can be severe in small samples, such as those used to produce the regional and production system tables. To circumvent issues of this kind, we now report the median of the data in the tables and graphs that are most at risk of showing such bias i.e. regional data. The median is the number that divides the data into two equal halves, such that half of the data is below and half the data is above this value. It is a robust and unbiased representation of the centre of the data. In the affected tables, entries will no longer add up to totals and sub-totals but provide a more accurate and representative value for the data. For example, in Table 7.1 below, we can see that by adding milk sales (net of dairy levy), net livestock sales (sales - purchases) and other dairy cash income, they do not add up to net dairy cash income, in contrast to the equivalent table presented in the 2018-19 version of the Economic Farm Survey.

The median is used in a number of different figures and tables:

- In Figure 3.1, we use the median deviation from the 30-year median rainfall. We do this because the arithmetic average is not robust to severe weather events that may misrepresent the true average rainfall a region receives in a season.
- In Tables 7.1, 7.2, 10.1 and 10.2, we report the median values for the table entries. Issues applying the *average of sums* methodology on these tables were identified in 2020. It was decided that accurate representation of these values was more important than ensuring the values added up in the table.

3 Physical Analysis

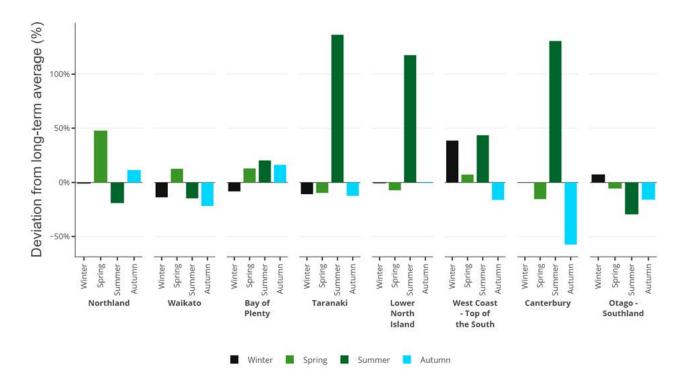

3.1 Introduction

The DairyNZ Economic Survey reports the trends in the financial performance of dairy farms but not all the trends in physical performance. While not presented, there are key physical indicators of milk production such as the days in milk, cow condition, reproductive performance, soil fertility, and fertiliser use data available in DairyBase®. It is the combination of the physical performance of the farm reflected through milksolids production, the cost of production and milk prices that drives the financial results.

3.2 Rainfall Summary

NIWA supplies daily climate data for various points across New Zealand with their Virtual Climate Station Network. These data are collated into district-level averages for each month, weighted for areas where more farms are located. Within each region, median rainfall for the October to December (spring), January to March (summer), April to June (autumn) and July to September (winter) periods was calculated. The variation in the median regional rainfall from the thirty-year-weighted median is shown in Figure 3.1. See section 2.11 for an explanation of the median methodology used here. Overall, some regions had significantly wetter summers than the thirty-year weighted median.

Figure 3.1: Variation in rainfall

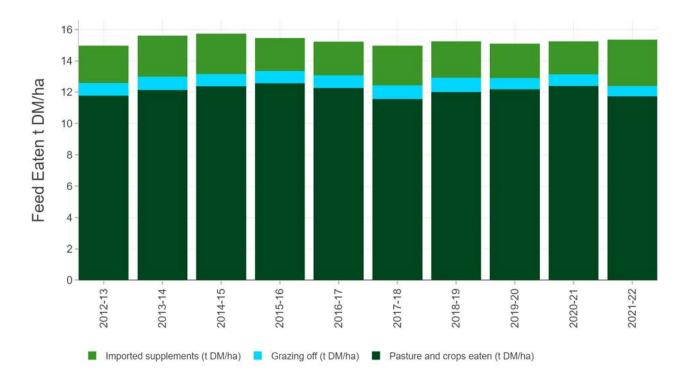

3.3 Feed Use

Pasture and crop eaten, grazing off farm, and imported feed were estimated from DairyBase® data. Pasture eaten decreased from 12.4 tDM/ha in 2020-21 to 11.7 tDM/ha in 2021-22 while the use of imported supplements increased from 2.11 tDM/ha to 2.97 tDM/ha, respectively (Figure 3.2).

In 2021-22, of the total feed eaten per hectare, approximately 77 percent corresponded to pasture and crops eaten, 19 percent to imported supplements and 4 percent to grazing off.

Figure 3.2: Trends in feed use

3.4 Partial Productivity

Milk production per cow and per hectare both decreased from last season (Figure 3.3 and 3.4). Milksolids sold per cow on the average Economic Survey dairy farm decreased from 421 kg in 2020-21 to 413 kg in 2021-22. Milksolids sold per hectare also decreased from 1,222 kg in 2020-21 to 1,199 kg in 2021-22.

Figure 3.3: Milksolids production per cow

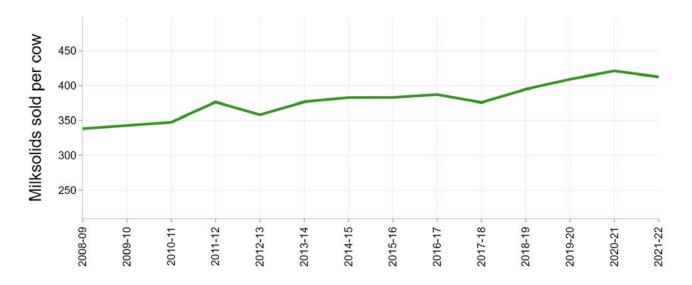

Figure 3.4: Milksolids production per hectare

3.4. PARTIAL PRODUCTIVITY 18

The number of cows per FTE has decreased in the last 5 years. In 2021-22, the number of cows per FTE was 142, 4 less than the previous season (Figure 3.5).

Figure 3.5: Cows per FTE

3.5 Profit from Productivity

Productivity improvements over time are essential to sustain or grow business profits and compete successfully with alternative uses for resources. DairyNZ has developed a measure for productivity based on operating profits. Operating profit from productivity (PFP) is defined as the difference between actual operating profit and the operating profit that would have occurred with no productivity changes since a base year (i.e. in the absence of milksolids production increases and with operating expenses per kilogram milksolids increasing annually at the rate of dairy farm input price inflation), see Figure 3.6. PFP is a measure of cost-efficient milksolids production increases since the base year, valued at the end of the year operating profit margin per kilogram of milksolids. It excludes the cost of capital, although depreciation and changes in hectares are accounted for. The three main contributory components of PFP are milksolids production increases since the base year, operating expenses savings in inflation-adjusted terms since the base year, and end year operating profit per kilogram milksolids (influenced by milk prices). DairyNZ and dairy farmers are increasingly focused on achieving cost-efficient milksolids production, and PFP provides a means for monitoring the value of productivity gains over time.

PFP decreased sligthly from \$995 per hectare in 2020-21 to \$972 in 2021-22 (1998-99 base year PFP = \$0/ha). Figure 3.6 shows the gains made in PFP were relatively steady from 1990-91 to 2006-07. However, sharper fluctuations in both milk prices and seasonal rainfall have caused PFP to be more volatile since.

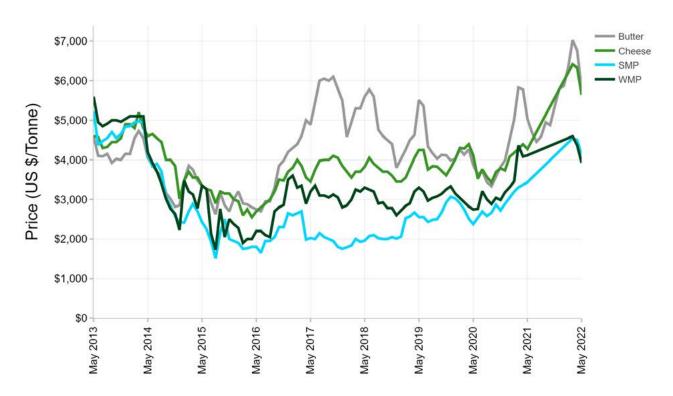

4 Prices Received and Paid

4.1 Milk Payment

Owner-operators in DairyBase® received an average cash payout of \$9.19/kg milksolids sold in 2021-22 (net of the industry good levy but includes advance and final payments). This was \$1.79 more than the previous season. The New Zealand Dairy Statistics 2021-22 publication reported an average nominal payout (including dividend payments) of \$9.52.

International dairy prices (as seen in Figure 4.1) increased in the first half of the season, but decreased towards the end of the season. With the exception of whole milk powder, the price of skim milk powder, cheese and butter in May 2022 was still higher than in May of the previous year.

Figure 4.1: World Milk Commodity Prices (\$US per tonne)

The 2021-22 average nominal milk payout reported by the New Zealand Dairy Statistics publication of \$9.52 per kilogram milksolids was \$1.8 above the decade average in inflation-adjusted terms (\$7.63) (Figure 4.2). The increase in milk payout per kilogram milksolids from 2018-19 reflects the strength of the international dairy commodity market in 2021-22.

Figure 4.2: Trend in Milk Payout (Nominal and Real)

4.2 Livestock Prices

The value of mixed aged dairy cows increased to \$1,697 in 2021-22 (from \$1,528 in the 2020-21 season). Dairy cow values, in nominal terms, were close to the decade-average of \$1,670. Historically, dairy cow values have followed the trend in milk prices, often with a slight time lag (Figure 4.3).

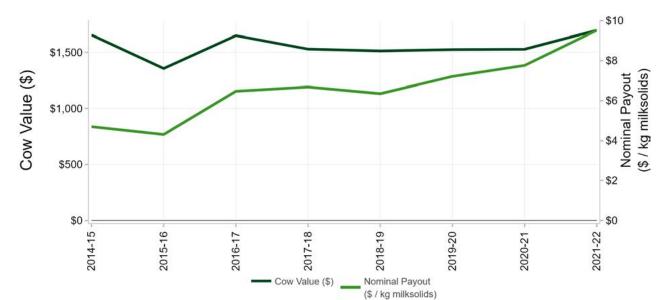

Figure 4.3: Trend in Cow Values Relative to Milk Payout

4.3 Feed and Fertiliser Prices

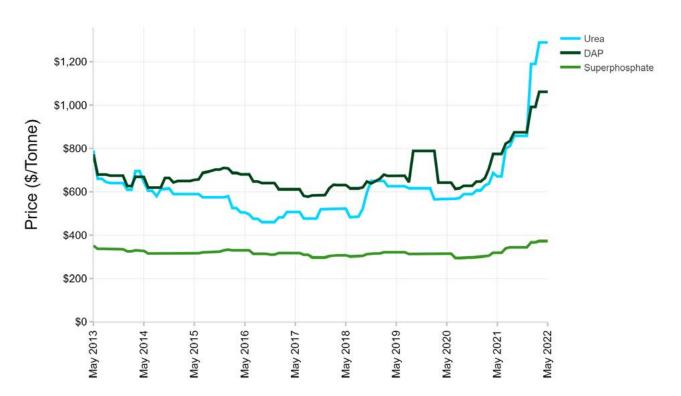

The price for barley, wheat and PKE increased during the 2021-22 season, with the rate of increase in price higher in the last 4 months of the season. Between June 2021 and May 2022, the price per tonne increased from \$412 to \$586 for barley, from \$416 to \$563 for wheat and from \$336 to \$516 for PKE. Of these feeds, PKE had the highest percentage increase in price during this time (+53%).

Figure 4.4: Feed Prices

During the 2021-22 season the price of fertilisers increased majorly (Figure 4.5). Between June 2021 and May 2022, the price (\$/t) of urea increased from \$672 to \$1,289, this represented a 92% increase in price during the season. The price of DAP increased by \$287/t to \$1,065/t, 37% higher than at the begining of the season. The price of superphosphate at the end of the season (\$373/t) was 17% higher than at the begining of the season.

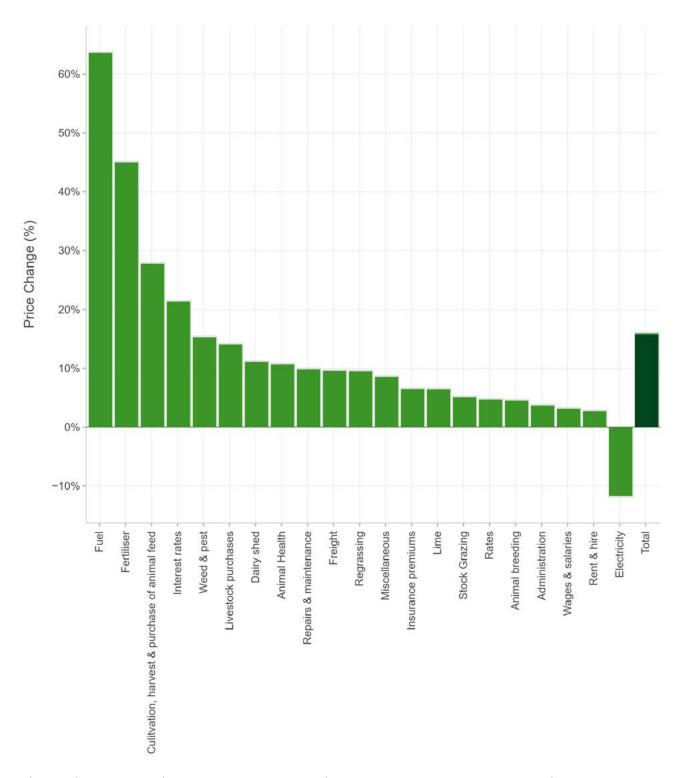

Figure 4.5: Fertiliser Prices

4.4 On-farm Inflation

Statistics New Zealand compiles the movement of on-farm input prices in the Farm Expenses Price Index for dairy farms. The percentage movement of each category is weighted by a three-year rolling average of the contribution of each category to total expenditure. In the year to June 2021, the overall change in expense price index was a 16 percent increase. The price movements of individual categories for the 2021-22 season are shown in Figure 4.6. The only price category to experience price reductions was electricity (-11%). The most notable increases included fuel (+63%), fertiliser (+45%), feed (+27%) and interest rates (+21%).

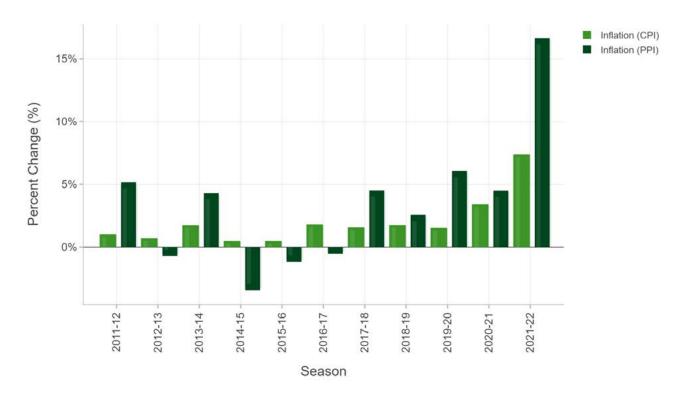

Figure 4.6: Dairy Input Price Changes 2021-22

The Producer Price Index (Stats NZ NZSIOC Level 3, June 2021 to June 2022) was up by 16%, as seen in

Figure 4.7. General inflation, as measured by the Consumer Price Index (CPI), experienced a large increase (+7%) in 2021-22.

Figure 4.7: Dairy Farm Producer Price Index and CPI Changes

5 Owner Operator: Operational Financial Analysis

5.1 Introduction

Operating profit of \$4,150 per hectare in 2021-22 was up 30 percent on the previous season. The milk payout received of \$9.19 per kilogram of milksolids was up \$1.79 (+24%) on the average price received in 2020-21. Both milksolids per cow (-8 kgMS per cow) and milksolids per hectare (-23 kgMS per hectare) decreased in 2021-22. Net livestock income (sales minus purchases) increased from by 12% 2021-22 to 2021-22 to \$0.55 per kgMS. Gross farm revenue was \$9.81 per kilogram milksolids in 2021-22, increasing \$1.87 compared to the previous season. Farm working expenses (FWE) of \$5.32 per kilogram of milksolids was 89 cents higher than the last season. Operating expenses increased \$1.03 to a record-high \$6.35 per kilogram of milksolids in 2021-22 compared to the previous season (second consecutive record-high in a row). The cash available for living and growth in 2021-22 was \$427,950 per farm, the highest value recorded in the past ten seasons.

5.2 Revenue

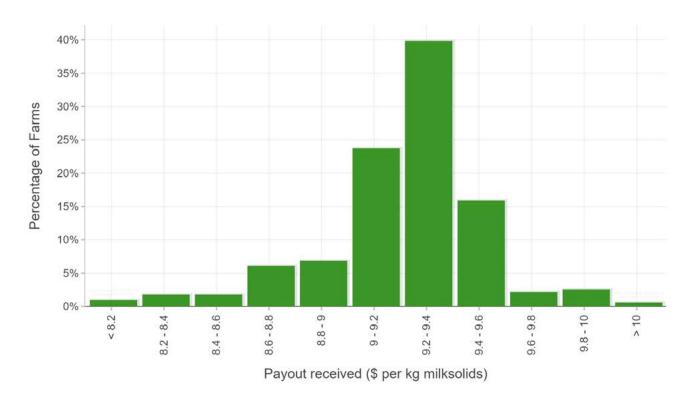

The milk payout received (including dividend payments) in 2021-22 increased by \$1.79 (+24%) from the previous season to \$9.19 per kilogram of milksolids. Milksolids production per cow and hectare, recorded by the Economic Farm Survey farms, decreased marginally in 2021-22 from the 2020-21 season. Milk sales per farm (net of dairy levies) increased by \$317,078 (+25%) from last season to another record-breaking figure of \$1.6 million (\$1,588,525). Milk revenue in 2021-22 increased by 1 percent relative to 2020-21, to account for 94 percent of gross farm revenue. Net revenue from livestock sales increased to \$95,756 in 2021-22. Livestock revenue accounted for 6% of the total gross farm revenue per farm. Table 12.1 describes average revenue per farm, while revenue values normalised by cows and effective hectares can be found in tables 12.2 and 12.3 respectively.

There is a variation of \$1.8 per kg MS in farmers' milk price within the 2021-22 season (Figure 5.1). These differences are driven by:

- · Variations in the milk composition (fat, protein, lactose, minerals),
- · Transport distances,
- · Annual account balance dates,
- Milk company supplied,
- · Different systems such as organics,
- · Penalties incurred,
- Whether the farm operated in the previous season.

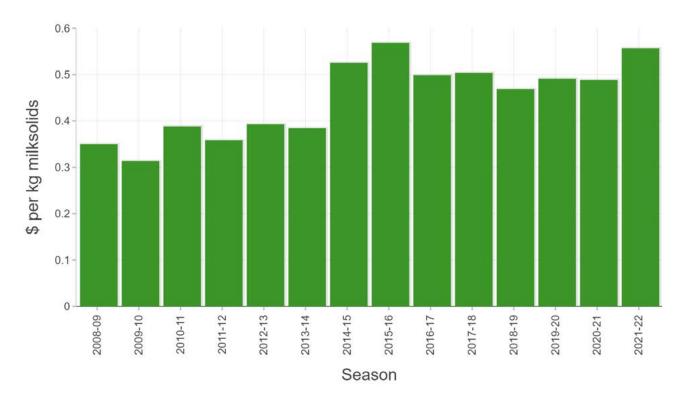

More than ninety percent of farms (91.4%) received a milk payout (milk price plus dividend) between \$8.6 and \$9.6 per kilogram of milksolids in 2021-22. The highest percentage was between \$9.20 and \$9.4, with 40 percent of farms receiving a milk payout in this range. Notably, the most common range is exactly \$2 per kilogram of milksolids more than the most common range in 2020-21.

Figure 5.1: Distribution of Milk Payout Received 2021-22

Cash income from net livestock sales increased to \$0.55 per kilogram milksolids in 2021-22 (+12%).

Figure 5.2: Net Livestock Sales (\$ per kg MS)

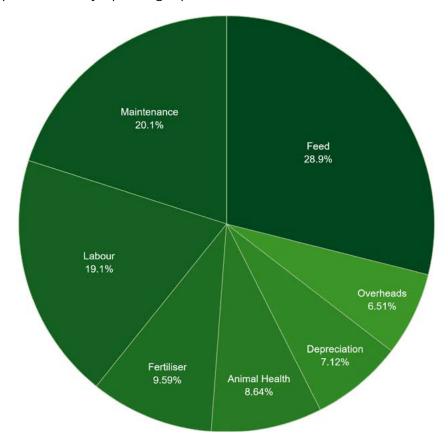

Tables 12.1, 12.2, 12.3 and 12.4 in chapter 12 show net cash income, cash farm working expenses and the adjustments made to calculate operating profit for the average New Zealand owner-operator on a per farm, per cow, per hectare and per kilogram milksolids sold basis.

5.3 Expenditure

Feed continues to be the largest expenditure category at 28.9 percent in 2021-22 and has been the largest expense category since 2007-08. Maintenance was the second-highest operating expense for dairy farms at 20.1 percent of total operating expenditure. Labour and fertiliser contributed 19.1 and 9.6 percent respectively. Figure 5.3 shows the major 2021-22 expenditure categories.

Figure 5.3: Proportion of Dairy Operating Expenditure 2021-22

Changes in the total farm expenditure are affected by the farm area, herd size and milksolids produced. Therefore, it is more appropriate to consider spending per cow, hectare or kilogram of milksolids to measure the movement of expenses for individual items. Average farm working expenses (i.e. cash expenses) per kilogram of milksolids increased 89 cents (+20%) to \$5.32. This was the highest expenditure recorded in a season.

Dairy operating expenses per kilogram milksolids were \$6.35, \$1.03 above the 2020-21 season. As with many of the trends over the season this was the highest level of operating expenses in the last decade with a larger change than typically observed. This was the first time that operating expenses per kilogram of milksolids exceeded \$6.

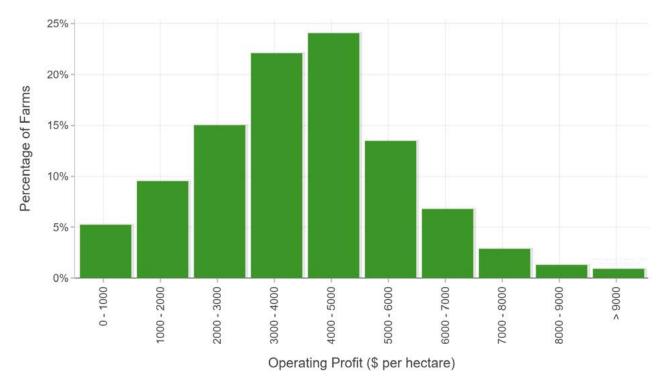

Table 12.4 shows the changes in the categories of operating expenses per kilogram milksolids. Many of these expenses have followed close to their long term trend. Feed, fertiliser and maintenance saw increases greater than the preceding years, driving up dairy operating expenses and therefore large variation in operating expenses from 2020-21 to 2021-22.

5.4 Profitability

Operating profit is a key indicator of dairy farm financial performance. This measure, expressed on a per hectare basis, is beneficial for comparing the profitability between farms. Operating profit incorporates adjustments to allow comparisons between farms, but does not include interest, tax, rent payments or capital expenditure. Table 12.3 shows the revenue and expenditure items included in operating profit.

Figure 5.4 shows the distribution of 2021-22 operating profit per hectare. Operating profit per hectare was distributed around the mean (\$4,150) per hectare, reflecting a wide range between farms. 89 percent of farmers had operating profits between \$0 and \$6,000 per hectare, while 11 percent of farmers had operating profits over \$6,000 per hectare. None of the Economic Farm Survey farms recorded a negative operating profit in 2021-22 (Figure 5.4).

Figure 5.4: Distribution of Owner-operating Profit (\$ per hectare) 2021-22

Tables 5.1 and 5.2 show the average size and profitability of farms by quartile. Quartiles were constructed by ranking surveyed farms on operating profit per hectare across New Zealand. Top quartile farms average \$6,353 operating profit per hectare, compared with \$1,744 for the bottom quartile group. Each quartile group produced more milksolids per hectare compared with the quartile lower. Top quartile farmers produced approximately 67 percent more kilograms of milksolids per hectare than the bottom quartile farmers, with substantially lower farm working expenses per kilogram of milksolids (-25%).

There is minimal difference in gross farm revenue per kg MS across the quartiles. The differences in profit per kilogram of milksolids between the quartiles is driven by significant differences in the groups operating expenses per kilogram of milksolids. Top farms are more efficient, demonstrated by the lower operating expenses per kilogram of milksolids. Operating expenses increased from the top quartile group to the bottom quartile group from \$5.55 to \$7.82 per kilogram of milksolids, respectively.

 Table 5.1: Owner-operator Quartile Profit (\$/kg MS)

| DEBT: | | | | |
| Closing term liabilities per kg MS | 25.42 | 24.12 | 24.07 | 21.35 |
| Closing debt to asset % | 40.7% | 45.9% | 48.4% | 44.3% |

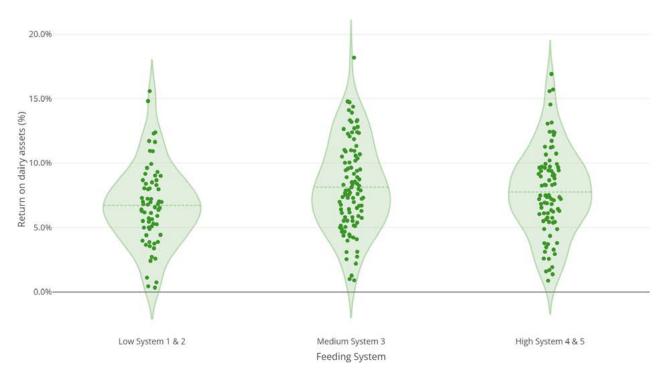

In high payout seasons, such 2013-14, 2019-20, and 2020-21 the correlation between milksolids production per hectare and operating profit per hectare strengthens, and the reverse is true in low milk payout seasons. The changes in relationships over the past decade are detailed in Table 5.3. Measuring the cost efficiency of milksolids production (operating expenses/kg MS) relative to milk price is more relevant than production or expenditure alone when focusing on how to achieve high-profit margins. The last two rows in Table 5.3 denote the strength of the association between the variables. A value of 0 percent denotes no association, while a value of 100 percent denotes a perfect association. The $\rm R^2$ values (R2 in Table 5.3) for the 2021-22 season demonstrate the correlation of a high milk payout with a small decrease in production.

Table 5.3: Correlations between Production, Profit and Operating Expenses

| | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17 | 2017-18 | 2018-19 | 2019-20 | 2020-21 | 2021-22 |

| R2 - dairy operating profit \$/ha & operating expenses \$/kg MS | 54.1% | 46.7% | 59.4% | 60.4% | 49.7% | 62.9% | 59.5% | 62.2% | 61.2% | 58.8% |

Operating return on dairy assets is a measure of the operating profit generated by the dairy assets employed at the start of the season. This measure excludes non-dairy activities and any change in capital value. The average operating return on dairy assets was 7.5 percent in 2021-22. Grouping farm systems into low (systems 1 and 2), medium (system 3) and high input (systems 4 and 5) show that the average operating return on dairy assets was highest for medium input farms (+6.4%, Figure 5.5). There was a significant difference in the variation of operating returns on dairy assets within the groups, with the highest range in the medium input farms (0.9% to 18.2%) and the lowest range in the low input farms (0.3% to 15.6%).

Business profit before tax is another measure of profitability that considers the cost of borrowing and other non-dairy activities. This is the overall profitability of the business enterprise and not just the dairy farm operation (Table 5.4).

Table 5.4: Business Profit before Tax

| | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17 | 2017-18 | 2018-19 | 2019-20 | 2020-21 | 2021-22 |
|---|---------|---------|---------|----------|---------|---------|---------|---------|---------|---------|
| BUSINESS PROFIT: | | | | | | | | | | |

| + Labour adjustment | 55,162 | 59,309 | 59,021 | 56,341 | 61,154 | 63,920 | 62,545 | 62,011 | 70,195 | 79,852 |
| + Owned support block adjustment | 14,601 | 15,338 | 14,889 | 14,126 | 14,359 | 16,786 | 13,143 | 16,151 | 16,720 | 18,843 |
| + Non-dairy operating profit | 1,288 | 1,724 | -673 | -318 | 3,331 | 5,444 | 6,904 | 11,894 | 3,870 | 5,499 |
| + Net off-farm income | 12,427 | 9,991 | 12,078 | 9,238 | 19,811 | 18,114 | 6,670 | 13,167 | 9,838 | -199 |
| - Rent (excl support block) | 22,812 | 23,366 | 22,250 | 20,047 | 19,582 | 20,703 | 12,499 | 17,280 | 17,069 | 14,929 |
| - Interest | 174,136 | 171,597 | 195,984 | 197,277 | 197,343 | 191,459 | 194,022 | 172,460 | 140,608 | 149,895 |
| Business profit before tax | 144,512 | 362,074 | 90,731 | -139,258 | 167,789 | 231,251 | 197,163 | 304,312 | 392,077 | 537,252 |
| Business profit before tax per all effective hectares | 785 | 1,981 | 478 | -734 | 887 | 1,174 | 1,077 | 1,681 | 2,131 | 2,868 |

Total effective hectares (effective dairy + effective dairy support block + effective non-dairy) increased by three hectares from the previous season to 187 hectares. The average dairy farm in 2021-22 made a business profit before tax of \$537,252 in 2021-22. This business profit is equivalent to \$2,868 per total effective hectare. The dairy operating profit increased by \$148,949 from the previous season. Rent payments decreased by 12 percent (-\$2,140). Interest payments in 2021-22 were higher than 2020-21, increasing by \$9,287.

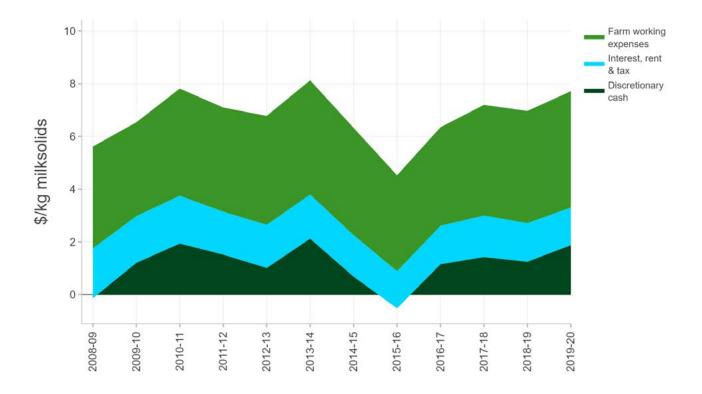

5.5 Cash Flow

The cash operating surplus is the difference between net dairy cash income and farm working expenses. In 2021-22 the cash operating surplus was \$771,689, constituting a 28 percent increase from 2020-21. On a per kilogram of milksolids basis, the cash operating surplus in 2021-22 was \$4.46, up 20 percent from the previous season. Once rent, interest and tax are paid, and net income from non-dairy farming activities are added, the amount left is discretionary cash. Total discretionary cash in 2021-22 was \$489,779, equating to \$2.83 per kilogram of milksolids (refer to Table 12.5).

Many farm businesses include cash funds and off-farm income in their annual accounts. The cash available after including these activities and any change of funds deposited or withdrawn from the IRD Income Equalisation Scheme is the cash available for drawings, debt repayments and/or capital development and purchases. Cash available for living and business growth in 2021-22 was \$427,950 per farm, larger than last season which was the highest to date.

Cash for living and growth can also be used to repay debt and for farm family drawings. Term debt decreased \$43,029 per farm during the year, and a large amount (\$267,306) was spent on capital transactions. Drawings increased \$8,194 to \$114,873 per farm. Tax payments increased to \$124,502 per farm (Table 12.5).

Figure 5.6: Annual Change in Revenue and Expenditure Over the Last 10 Years (\$ per kg MS)

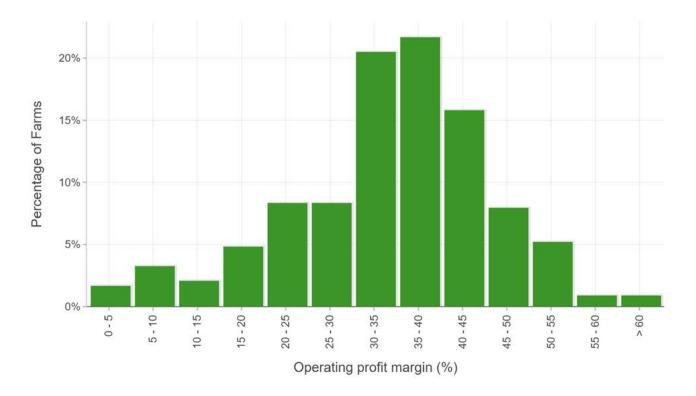

5.6 Operating Profit Margin

Operating profit margin is an indicator of dairy farm financial performance. This measurement is expressed as a percentage and describes the proportion of gross farm revenue converted to profit. The ability of a farmer to convert a high proportion of their revenue to profit indicates that the farm is cost-efficient and better placed to deal with financial and production risks. Figure 5.7 shows the distribution of operating profit margins. The average operating profit margin was 35.3 percent, up 2.4 percent from the 2020-21 season. The highest proportion of farms (21%) made an operating profit margin between 35 to 40 percent.

Operating profit margin had a wide distribution ranging from 0 to 65 percent. 65 percent of farmers had an operating profit margin between 30 and 50 percent, and no farmers had a negative operating profit margin.

Figure 5.7: Distribution of Operating Profit Margin (%) 2021-22

6 Owner Operator: Equity and Capital Financial Analysis

6.1 Introduction

This section considers dairy farms' equity and capital position, with additional information about trends over time.

Following significant capital expenditure and changes in debt and drawings, a cash surplus of \$2,543 was recorded in 2021-22, a \$56,569 decrease from 2020-21. The operating return on dairy assets increased to 7.6 percent in 2021-22. Total return on equity increased to 11.5 percent. The Return for equity increased on average by \$260,156. The 2021-22 season was the first in five seasons to experience positive changes in land value, where the \$124,639 increase contributed to the aforementioned growth in Return for equity. Total liabilities as a percentage of total assets (debt to asset ratio) decreased to 47.4 percent at the end of the season. Closing term liabilities per kilogram of milksolids decreased to \$23.56.

6.2 Dairy Assets

Compared to the 2020-21 season, the number of dairy farms sold in 2021-22 marginally increased by 1 percent (2 farms) to 200. The REINZ average sales price per kilogram of milksolids and hectares for the last seasons is shown below in Table 6.1. Hectares are measured as total rather than effective area, which is generally used in this publication. Raw data from REINZ was weighted by the number of farms in each region, and the analysis only includes farms considered to be economic units. Dairy land prices have decreased in the past five seasons from \$40 in 2017-18 to \$35 per kilogram of milksolids in both 2020-21 and 2021-22. This corresponds with a reduction from \$43,483 to \$34,427 per hectare, however, this season there was a slight recovery from this reduction as the average sale price/ha increased by 9.67 percent.

Table 6.1: Average Sales Price and Number of Dairy Farms Sold

| | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17 | 2017-18 | 2018-19 | 2019-20 | 2020-21 | 2021-22 |
|---|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| FARM SALES: | | | | | | | | | | |
| Farms sold | 197 | 312 | 244 | 192 | 217 | 226 | 148 | 113 | 198 | 200 |

| Average \$ sale price/ha | 33,557 | 36,369 | 39,577 | 36,557 | 37,835 | 38,015 | 36,846 | 33,410 | 31,393 | 34,427 |
| Average \$ sale price/ha (real 2019-20 dollars) | 40,625 | 43,307 | 46,935 | 43,177 | 43,926 | 43,483 | 41,452 | 37,048 | 33,685 | 34,427 |

6.3 Liabilities and Debt Servicing

Interest is the cash cost of borrowing funds, while rent is the cost of borrowing assets. Interest and rent totalled \$0.95 per kilogram of milksolids. Borrowing costs represented 9.7 percent of gross farm revenue (Table 6.2). Therefore, for every dollar of gross income earned, 9.7 cents is required to pay interest and rent.

Table 6.2: Debt Servicing Ratios

| | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17 | 2017-18 | 2018-19 | 2019-20 | 2020-21 | 2021-22 |
|---------------------------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| DEBT SERVICING: | | | | | | | | | | |
| Interest & rent \$/kg MS | 1.39 | 1.29 | 1.36 | 1.36 | 1.35 | 1.31 | 1.24 | 1.12 | 0.92 | 0.95 |
| Interest & rent % GFR | 20.2% | 15.6% | 21.5% | 30.5% | 21.2% | 18.2% | 17.7% | 14.7% | 11.6% | 9.7% |
| Term liabilities \$/kg MS | 20.82 | 20.14 | 21.26 | 22.49 | 25.00 | 25.31 | 24.92 | 23.25 | 22.37 | 23.56 |

The debt to asset ratio decreased from 50.1 percent at the close of 2020-21 to 47.4 percent in 2021-22 (Table 12.6). Debt to asset values have been around 50 percent for the past six seasons but were at lower

levels before that. This season is the first since 2016/17 where debt to asset values have been below 50 percent.

Figure 6.1 shows the debt to asset distribution in 2021-22, with an average of 50.1 percent. Thirty-five percent of farms have a debt to asset ratio below 40 percent. Nine percent of the farms had a debt to asset ratio over 70 percent, with none sitting in the high-risk area of over 90 percent. Compared to the 2020-21 season the number of farms in the higher debt to asset categories fell, while the number in lower categories rose.

Figure 6.1: Debt to Asset Distribution 2021-22

Over the last ten years, the average farm has increased its milksolids production by 21.6 percent, while term liabilities have increased nearly twice as fast (+38%) to \$4 million per farm. In 2021-22, farmers increased their term liabilities by 6 percent.

Debt to asset ratio (%)

6.4 Liquidity

Given the high profitability and cash available for living and growth, a cash operating surplus of \$771,689 was recorded in 2021-22, increasing \$170,197 compared to the last season. Table 6.3 shows a breakdown of the changes in working capital, including the source and application of cash funds. The majority of the source of funds in 2021-22 was from the current season's farming operations. The change in working capital increased to \$265,474 this season, reflecting an increase in current assets (+\$68,404), with a proportionately larger increase in current liabilities (+\$38,858). Net debt decreased for the third season in a row, decreasing \$43,029. Cash from the income equalisation scheme was at -\$1,643 per farm in 2021-22. After the farming operations, 21 percent of cash was spent on interest and rent payments for borrowing, while net capital transactions, development and purchases (35%) were the other large cash expenditure area in 2021-22. Drawings from the dairy business, for farm family living and so forth (15%), and tax payments (16%) make up the remainder of the cash spent.

6.5 Returns

The return on dairy assets is discussed under farm profitability (Section 5.4). The total return on assets considers operating profit from both dairy and non-dairy farming operations, plus the change in the value of capital assets. The total return on assets in 2021-22 was 7.5 percent. The 2021-22 total return on assets comprised 7.6 percent net return from all farming operations and -0.05 percent net return from capital.

For the past decade, the total return on assets has ranged between -4.1 and 9.6 percent, driven by changes in the value of land and buildings, dairy company share values, livestock values and profits (Table 12.7)

6.5. RETURNS

Figure 6.2: 2021-22 Owner Operator Total Return on Assets

The percentage return on equity is the return on the owner's funds, including capital changes after interest is paid (Table 12.7). The return on equity will be higher than the total return on assets when the latter is greater than the cost of debt and vice versa. In 2021-22 the total return on equity was 11.5 percent compared to 7.5 percent total return on assets. In 2015-16, the negative equity was due to low profitability, and in 2017-18, 2018-19 and 2019-20, the negative returns were due to reduced capital values. Ideally, the return on assets should be above the returns for alternative investments of similar risk, such as shares or other forms of property investment.

7 Owner Operator: Regional and Systems Financial Analysis

7.1 Regional Profitability

DairyBase® classifies farms into eight regions, five in the North Island and three in the South Island (refer to Section 2.6). The values reported in Table 7.1 and 7.2 are *median* values to reduce numerical bias created by the *average of sums* methodology in regional samples. Thus, totals and sub-totals in these tables will not add up but will better represent the average values of the data sample. See section 2.11 for an explanation of this methodology.

Table 7.1 shows the values of key performance indicators (KPI) per kilogram of milksolids in the eight regions, for the 2021-22 season. Dairy farms in the Taranaki region had the smallest herd size (281 cows), followed by Lower North Island (295). The Canterbury and Otago-Southland regions had the largest herd sizes in the South Island and the rest of the country, with 730 cows and 611 cows, respectively.

Northland and Lower North Island had the lowest stocking rates in the country, with 2.2 and 2.4 cows/ha, respectively, while Canterbury had the highest stocking rate (3.6 cows/ha). The remaining regions had an stocking rate that varied between 2.6 and 2.9 cows/ha.

Northland recorded the lowest average milksolids production per cow of all the regions (345 kg MS). The other four North Island regions recorded milksolids per cow between 380 and 402 kg MS. Canterbury and Otago-Southland recorded similar milksolids production per cow of 444 and 437 kilograms, respectively. However, Canterbury production is considerably higher on a per hectare basis due to its higher stocking rate.

The average payout received in each region was at or above \$9.19 per kilogram of milksolids. Regional average farm working expenses (FWE) per kilogram milksolids were lowest in Lower North Island (\$4.13), and the highest FWE per kilogram of milksolids was reported in both Canterbury and Otago-Southland (\$5.60). The other regions reported average FWE between \$5.06 and \$5.41. The bottom of Table 7.1 shows the regional gross farm revenue, operating expenses and operating profit levels on a per hectare basis in 2021-22. Canterbury (\$5,950), Otago-Southland (\$4,118), and Taranaki (\$4,114) recorded the highest operating profit on a per hectare basis, while Northland recorded the lowest operating profit at \$2,401 per hectare. Farms in the Lower North Island and Canterbury experienced higher levels of profitability in 2021-22 relative to other regions in terms of dairy operating profit on a milksolids basis, and operating profit margin on a hectare basis.

| Operating profit margin | 34.82% | 34.46% | 32.75% | 35.76% | 40.81% | 31.50% | 40.29% | 30.54% |

7.1. REGIONAL PROFITABILITY

Table 7.2 shows the values for the key indicators of financial position for the eight regions in 2021-22. The values reported in this table are medians; see section 2.11 for an explanation of this methodology. Regional average operating returns on dairy assets ranged between 6.5 and 10.0 percent. West Coast - Top of the South (10.0%) and Canterbury (9.8%) had the highest operating returns on dairy assets in 2021-22. Waikato had the lowest operating returns on dairy assets (6.5%). All regions reported positive total returns on assets, with West Coast - Top of the South recording the highest (10.0%) and Taranaki recording the lowest (4.6%).

Total return on equity is the return on the owner's funds, including capital changes after interest is paid. No regions experienced a negative return on equity. The largest growth in equity was recorded for West Coast - Top of the South (19.5%), followed by Waikato (15.0%).

Average term debt per kilogram of milksolids stayed relatively constant in 2021-22 with some regional variation. Taranaki was the highest (\$31.70) and West Coast - Top of the South was the lowest (\$14.65). Debt to asset levels varied heavily regionally, West Coast - Top of the South was the lowest (40.0%) while Taranaki was the highest (55.1%).

Table 7.2: Regional Owner-operator Financial Position

| | Northland | Waikato | Bay of Plenty | Taranaki | Lower North Island | West Coast - Top of the South | Canterbury | Otago - Southland |
|---------------------------------------|-----------|---------|------------------|----------|--------------------------|--|------------|----------------------|

41

7.2 Production Systems

DairyBase® categorises farms into five production systems based on the quantity of feed purchased (including cow grazing) and the timing and use of imported feed (refer to Section 2.7 for production system descriptions). For the following analysis, the systems have been combined to produce three categories; low (systems 1 and 2), medium (system 3) and high (systems 4 and 5). Within each production system, there is variation in milksolids production and profitability. The production system type is not a good indicator of profitability as a farm can be profitable (or unprofitable) operating at any system. Profit is less to do with the production system type and more to do with the management, milksolids production and the costs within the production system.

The averages reported in Table 7.3 and 7.4 are *median* values to reduce numerical bias created by the **average of sums** methodology in regional samples. Thus, totals and sub-totals in these tables will not add up, but will better represent average values in the data sample. See section 2.11 for an explanation of this methodology.

Average herd sizes, milking area and stocking rates increase from low to high production systems. Average milksolids per cow and per hectare also follow this trend, reflecting higher inputs of supplementary feed. Table 7.3 shows the key 2021-22 average performance indicators per kilogram of milksolids in the three production system categories. On average low system farms recorded 357 kgMS per cow, medium system farms recorded an average of 397 kgMS per cow while high input farms recorded an average of 436 kgMS per cow. The average milksolids production per hectare for medium input farms (1,105 kg) was 156 kilograms higher than low input farms (949 kg) and 191 kilograms less than the average for high input farms (1,296 kg).

Dairy cash income per kilogram of milksolids was highest for high input systems (\$9.28) due to milk sales being greater than the other two systems on a per kilogram of milksolids basis. Low input (\$9.24) and medium input systems (\$9.23) had similar average dairy cash incomes per kilogram of milksolids. Farm working expenses per kilogram of milksolids were \$4.87 for low input systems, \$5.11 for medium input systems and \$5.62 for high input systems.

Cash operating surplus per kilogram of milksolids was the highest for low input systems (\$4.90), followed by medium input systems (\$4.73). High input systems recorded the lowest average cash operating surplus of \$4.17 per kilogram of milksolids. Operating profit per kilogram of milksolids was highest for medium input farms (\$3.72), although high input (\$3.25) and low input systems (\$3.51) were not far behind. Operating profit per hectare was highest for medium input systems (\$4,224). Operating profit per hectare was \$3,297 per hectare for low systems and \$4,170 for high input systems.

7.2. PRODUCTION SYSTEMS

Table 7.4 shows key 2021-22 average financial indicators in the three production system categories. The averages reported in this table are medians; see section 2.11 for an explanation of this methodology. The operating return on dairy assets was highest for medium input farms (7.8%) and lowest for low input farms (6.6%). Once capital and non-dairy operations were included, the average total return on assets was 5.4 percent for low input farms, 6.8 percent for medium input farms and 6.9 percent for high input farms. For all three production systems, the operating return on dairy assets was higher than the total return on assets due to a reduction in capital values. All production systems saw a reduction in closing debt to asset ratio relative to the previous year where low input farms had the smallest debt to asset ratio (41.1%). Medium input farms had a debt to asset ratio of 48.9 percent and high input farms had a debt to asset ratio of 54.8 percent. Closing term liabilities per kilogram of milksolids were highest for low input systems (\$24.35). The average closing term liabilities for medium input systems were \$22.49, and for high input systems were \$22.78.

All farm system types had positive average growth in equity percentages. Average growth in equity for low input systems was 5.5 percent, medium input systems recorded the most significant growth in equity of 8.2 percent, and high input systems recorded an average growth in equity of 7.3 percent.

Table 7.4: Owner-operator Production Systems Financial Position

8 50:50 Sharemilkers: Operational Financial Analysis

8.1 Introduction

Operating profit per hectare for 50:50 sharemilkers (herd owning sharemilkers) increased by 37 percent to \$1,764 per hectare in 2021-22. The higher payout received offset the reduction in milksolids production per hectare (from 1,300 kg to 1,227) and peak cows milked (from 424 to 422). Operating expenses per kilogram of milksolids increased by 15 percent to \$3.61. The average cash available for living and growth decreased to \$249,488 per farm, an decrease of \$8,890 from 2020-21 (Table 13.5). With increased capital expenditure, drawings and debt, a cash surplus of \$38,556 was recorded in 2021-22 (Table 13.5).

Tables 13.1, 13.2, 13.3 and 13.4 in Chapter 13 show net cash income, cash farm working expenses and the adjustments made to calculate operating profit for the average New Zealand 50:50 sharemilker on a per farm, per cow, per hectare and per kilogram milksolids sold basis.

8.2 Revenue

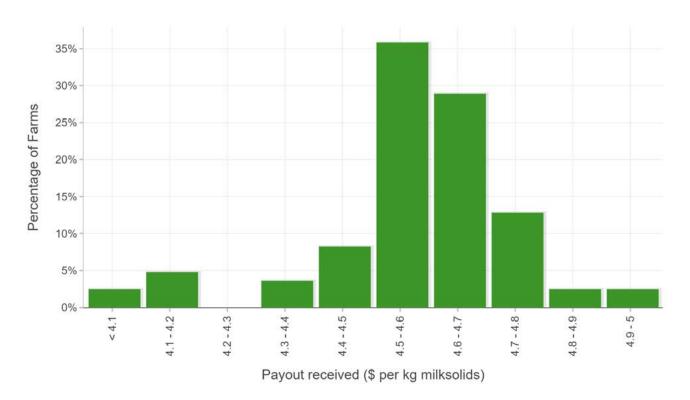

The milk payout received (including dividend payments) in 2021-22 increased 89 cents (24%) from the previous season to \$4.54 per kilogram of milksolids. Both, kilograms of milksolids sold per cow and per hectare decreased from 2020-21 to 2021-22, by 23 and 73 kg MS, respectively. Milk sales per farm (net of dairy levies) were higher than in the previous season (\$778,049). Milk revenue in 2021-22 accounted for 93 percent of gross farm revenue. Livestock revenue accounted for 6.3 percent of the total gross farm revenue per farm.

Figure 8.1 shows the variation in milksolids payout received by farmers in the 2021-22 season. These differences are driven by:

- · Differences in the percentage of milk payment received,
- · Variations in the milk composition (fat, protein, lactose, minerals),
- · Annual account balance dates,
- · Milk company supplied,
- · Different systems such as organics,
- · Penalties incurred, and,
- Whether the sharemilker operated in the previous season.

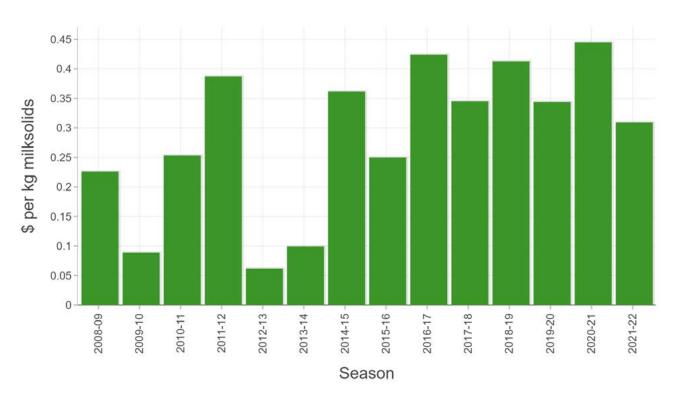

The majority (64%) of farmers in this business type received a milksolids payout between \$4.50 and \$4.70.

Figure 8.1: Distribution of Milk Payout Received 2021-22

Cash income from net livestock sales decreased by \$0.14 to \$0.31 per kilogram of milksolids in 2021-22 (Figure 8.2). Net livestock sales per cow decreased by \$65 to \$125, the lowest from the last 6 seasons.

Figure 8.2: Net Livestock Sales (\$ per kg MS)

Dairy gross farm revenue for a typical New Zealand sharemilker was \$865,070 and was larger than the previous season by 15 percent (\$750,010 in 2020-21). On a per hectare basis, gross farm revenue of \$6,198 was higher (+16%) in 2021-22 compared to 2020-21.

Tables 13.1, 13.2, 13.3 and 13.4 show net cash income, cash farm working expenses and the adjustments

made to calculate operating profit for the average New Zealand owner-operator on a per farm, per cow, per hectare and per kilogram milksolids sold basis.

8.3 Expenditure

Labour continues to be the largest category of expenditure at 29.3 percent in 2021-22. Feed was the second-highest operating expense at 27.8 percent. Maintenance and animal health contributed 15.1 and 14.2 percent, respectively. Figure 8.3 shows the major 2021-22 expenditure categories for sharemilkers.

Feed
27.8%

Labour
29.3%

Overheads
4.36%
Animal Health
14.2%

Animal Health
14.2%

Figure 8.3: Proportion of Dairy Operating Expenditure 2021-22

Changes in total farm expenditure for sharemilkers are primarily affected by the herd size and milksolids produced, since sharemilkers primarily pay animal related costs. Compared to the previous season, farm working expenses (FWE) per farm increased by 8 percent to \$489,795. On a per kilogram of milksolids basis, FWE increased 38 cents to \$2.86. After adjustments for resources used but not paid for with cash, operating expenses per kilogram of milksolids were 48 cents higher (\$3.61) than in 2020-21.

8.4 Profitability

Operating profit is a key indicator of dairy farm financial performance. This measure, expressed on a per hectare basis, is useful for comparing the profitability between farms. Operating profit incorporates adjustments to allow comparisons between farms but does not include interest, tax or rent payments. Tables 13.1, 13.2, 13.3 and 13.1 show the revenue and expenditure items included in operating profit. Operating profit per hectare in 2021-22 was higher than in the previous 10 seasons.

Figure 8.4 shows the distribution of operating profit per hectare in the 2021-22 season. Sixty-two percent of farmers had operating profits between \$1,000 and \$2,500 per hectare, while 1.2 percent of farmers had operating profits over \$4,000 per hectare. About 3.5 percent of farms recorded a negative operating profit in 2021-22 (Figure 8.4).

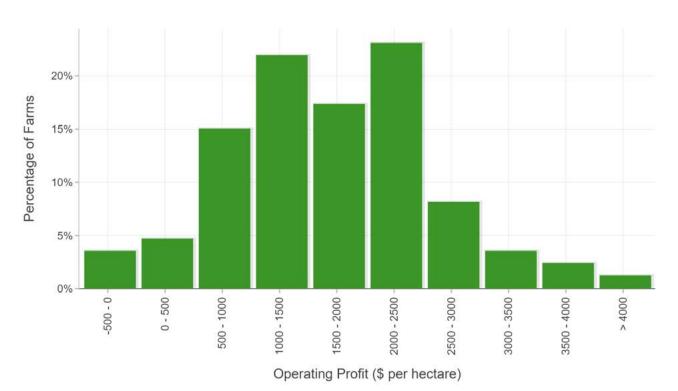

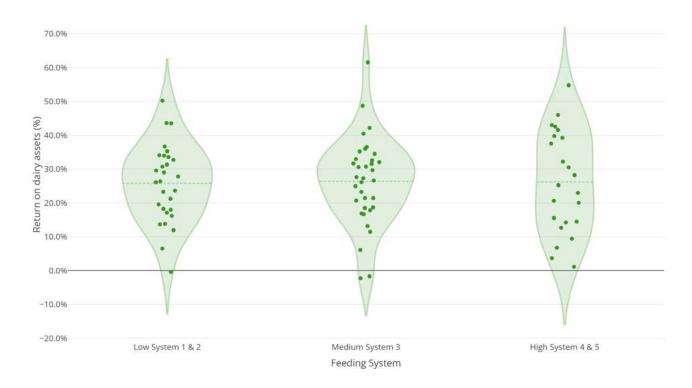

Figure 8.4: Distribution of Operating Profit (\$ per hectare) 2021-22

Operating return on dairy assets measures the operating profit generated by the dairy assets employed at the start of the season. This measure excludes non-dairy activities and any change in capital value. Operating returns on dairy assets for sharemilkers are more volatile than owner-operators because sharemilkers' dairy assets primarily consist of livestock. The average operating return on dairy assets for sharemilkers increased to 26.9 percent in 2021-22. Grouping farm production systems into low (systems 1 and 2), medium (system 3), and high input (systems 4 and 5) show that the average operating return on dairy assets was similar for high, medium and low input farms (26%). Figure 8.5 shows the distribution of operating return on dairy assets by production systems. High input systems are more likely to be located in higher producing regions such as Canterbury and Otago-Southland.

Figure 8.5: Return on Dairy Assets Distribution 2021-22

Business profit before tax is another measure of profitability that considers the cost of borrowing and other non-dairy activities, measuring the overall profitability of the business enterprise and not just the dairy farm operation (Table 8.1).

Table 8.1: Business Profit before Tax

| | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17 | 2017-18 | 2018-19 | 2019-20 | 2020-21 | 2021-22 |

| Business profit | 854 | 1,484 | 755 | -75 | 841 | 967 | 951 | 1,260 | 1,577 | 2,202 |
| before tax per all | | | | | | | | | | |
| effective hectares | | | | | | | | | | |

The average sharemilker in 2021-22 made a business profit before tax of \$341,787, up \$77,746 per farm compared to the previous season. This business profit is equivalent to \$2,202 per all effective hectares (effective dairy + effective dairy support block + effective non-dairy). Combined interest and rent payments were slightly down on last season.

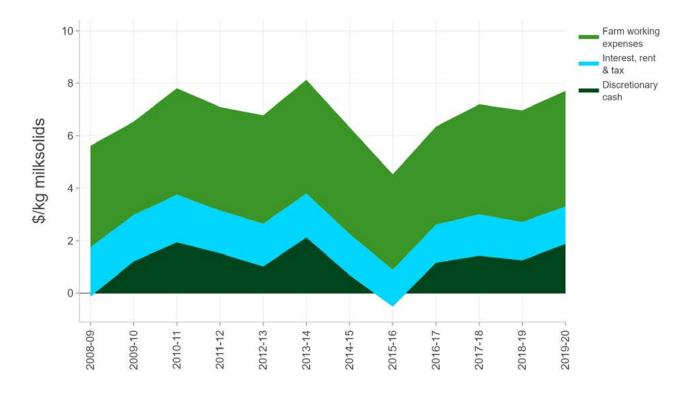

8.5 Cash Flow

The cash operating surplus is the difference between net dairy cash income and farm working expenses. In 2021-22, the average sharemilker cash operating surplus of \$344,252 increased by 15 percent from the previous season. On a per kilogram milksolids basis, the \$2.01 cash operating surplus was up 37 cents from last season. Once rent, interest and tax are paid, and net income from non-dairy farming activities are added, the remaining value is discretionary cash. Total discretionary cash in 2021-22 was \$258,608, equating to \$1.51 per kilogram milksolids (refer to Table 13.5).

Many farm businesses include cash funds and off-farm income in their annual accounts. The cash available after including these activities and any change of funds deposited or withdrawn from the IRD Income Equalisation Scheme is the cash available for drawings, debt repayments and/or capital development and purchases. Cash available for living and business growth in 2021-22 was \$249,488 per farm, down 3.4 percent from last season.

Cash for living and growth can also be used to repay debt and for farm family drawings. During the year, term debt increased \$39,955 per farm to \$60,025, and capital transactions of \$84,090 were down 30 percent from last season. Drawings increased slightly (+\$3,492) to \$79,739 per farm. Tax payments increased to \$79,532 per farm (Table 13.5).

Figure 8.6: Annual Change in Revenue and Expenditure Over 10 Years (\$ per kg MS)

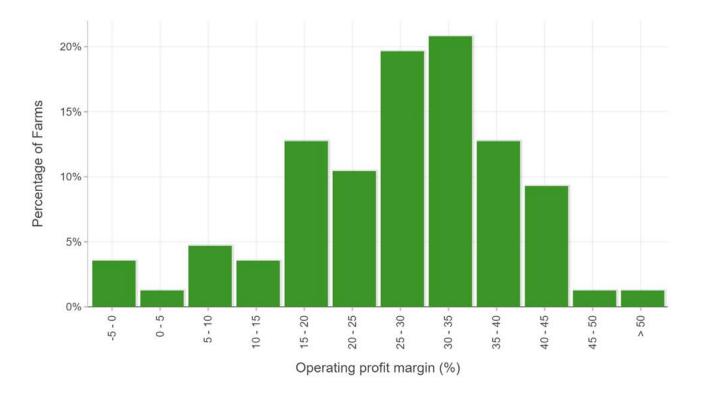

8.6 Operating Profit Margin

Operating profit margin is an indicator of dairy farm financial performance. This measurement is expressed as a percentage and describes the proportion of gross farm revenue converted to profit. The ability of a farmer to convert a high proportion of their revenue to profit indicates that the farm is cost-efficient and better placed to deal with financial and production risks. Figure 8.6 shows the distribution of operating profit margins. The majority of farms (52.9 percent) had an operating profit margin between 25 and 40 percent.

Operating profit margin had a wide distribution, with 3.5 percent having a negative operating profit margin and 2.3% having an operating profit margin above 45 percent.

Figure 8.7: Distribution of Operating Profit Margins (%) 2021-22

9 50:50 Sharemilkers: Equity and Capital Financial Analysis

9.1 Introduction

This section considers dairy farms' equity and capital position, with additional information about trends over time in these positions.

Net capital transactions decreased by 30 percent to 84,090 in 2021-22, while tax payments increased (+33%) to 79,532. The proportion of source funds applied decreased in 2021-22 from \$277,464 to \$263,300, resulting in a cash surplus of \$38,556 (Table 13.5). This constitutes a 25 percent decrease from the 2020-21 season. The operating return on dairy assets increased to 26.9 percent, and the total return on assets was 23.6 percent (Table 13.7). Sharemilkers' equity increased by \$163,084 to \$969,209, with significant increases in growth in equity from profit (+43%) and growth in equity from capital (+177%). Total liabilities as a percentage of total assets (the debt to asset ratio) decreased to 36.5 percent at the end of the season. Closing term liabilities per kg of milksolids decreased from \$2.91 (2020-21 season) to \$2.67 (2021-22 season).

9.2 Dairy Assets

Total dairy assets increased by \$104,331 in the 2021-22 season, closing at \$1.25 million per farm (Table 13.6). Livestock constitutes the highest proportion of sharemilkers' dairy assets, comprising 67 percent of total dairy assets at closing.

9.3 Liabilities and Debt Servicing

Interest is the cash cost of borrowing funds, while rent is the cost of borrowing assets. Interest & rent in 2021-22 totalled \$0.12 per kilogram of milksolids, similar to that of the previous year.

The flow of funds (Table 9.1) shows the components of the change in working capital, including the source and application of cash funds. Funds for 2021-22 were mostly from farm operations. Term debt increased (\$60,025) on loans at the season's close. Of the funds applied, 30 percent was spent on drawings (3 percentage points higher than the previous season), 32 percent on capital transactions, and 7 percent on interest payments. Tax payments required 30 percent of funds at \$79,532 per herd.

Table 9.1: Flow of Funds

The 2021-22 average 50:50 sharemilkers' cash operating surplus was \$344,252 (Table 9.1), higher than that recorded in the previous season (\$298,298). This translates to \$2.01 per kilogram of milksolids (Table 13.5). The 2021-22 average level of discretionary cash was \$258,608, increasing \$28,575 from 2020-21. Average discretionary cash for sharemilkers has maintained a strong position since the 2016-17 season. Term liabilities declined to \$2.67 per kg MS at the close of the 2021-22 season (Table 9.2).

Table 9.2: Debt Servicing Ratios

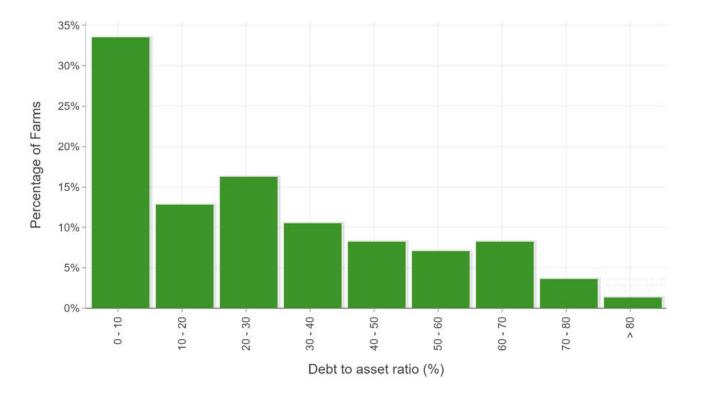

| | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17 | 2017-18 | 2018-19 | 2019-20 | 2020-21 | 2021-22 |
|---------------------------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| DEBT SERVICING: | | | | | | | | | | |
| Interest & rent \$/kg MS | 0.27 | 0.27 | 0.24 | 0.27 | 0.25 | 0.23 | 0.20 | 0.16 | 0.12 | 0.12 |
| Interest & rent % GFR | 7.0% | 6.2% | 7.1% | 11.5% | 7.3% | 6.1% | 5.6% | 4.1% | 2.9% | 2.3% |
| Term liabilities \$/kg MS | 3.64 | 3.71 | 3.36 | 4.07 | 4.05 | 3.81 | 3.78 | 3.19 | 2.91 | 2.67 |

The debt to asset ratio decreased from 43 percent at the close of 2020-21 to 37 percent in 2021-22. Debt to asset values have significantly fallen from a period of high debt to asset ratios from 2015-16 to 2018-19, corresponding with stronger milk payouts for sharemilkers.

Figure 9.1 shows the distribution of debt to asset ratio for the 2021-22 season. About 72 percent of farms had a debt to asset ratio below 40 percent. Less than five percent of farms had a debt to asset ratio over 70 percent.

9.4. RETURNS 54

9.4 Returns

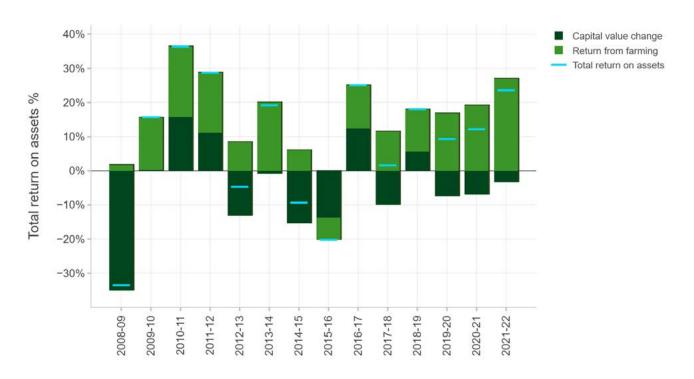

The return on dairy assets is discussed under farm profitability (Section 8.4). The total return on assets considers operating profit from both dairy and non-dairy farming operations, plus the change in the value of capital assets. The total return on assets in 2021-22 was 23.6 percent (Table 13.7).

Net returns from dairy activity yielded \$246,971 across the 2021-22 season, combined with an average change in capital value of -\$60,109 per herd. Sharemilker returns are more volatile than those earned by Owner-operators due to livestock being their largest asset class and livestock values fluctuating with greater magnitude than land prices.

During the last 10 years (2012-13 to 2021-22) the total return on assets has ranged between -20.2 and 23.6 percent, as a result of changes in capital and returns from farming operations (Figure 9.3)

9.4. RETURNS

Figure 9.2: Sharemilker Total Return on Assets 2021-22

The percentage return on equity is the return on the owner's funds, including capital changes after interest is paid (Table 13.7). The return on equity will be higher than the total return on assets when the latter is greater than the cost of debt and vice versa. In 2021-22 the total return on equity was 42.5 percent (Table 13.7), significantly higher than the total return on assets (23.6 percent). The 2021-22 season was the fourth season in a row with a positive return on equity.

10 50:50 Sharemilkers: Regional Financial Analysis

10.1 Regional Profitability

DairyBase® classifies farms into eight regions, five in the North Island and three in the South Island (refer to Section 2.6). Table 10.1 and 10.2 shows key 2021-22 average performance indicators per kilo milksolids for 50:50 sharemilker farms in these eight regions. The low number of farms in the regions presented here may also reduce the representativeness of the sample. Both Table 10.1 and 10.2 report *median* values to reduce numerical bias created by the *average of sums* methodology in regional samples. Thus, totals and sub-totals in these tables will better represent average values of the data sample, but will not add up. See section 2.11 for an explanation of this methodology.

Table 10.1 shows key 2021-22 average performance indicators per kilogram of milksolids in the eight regions. Bay of Plenty had the smallest average herd size of 275 cows, followed by Taranaki (304). Average herd sizes in the South Island were considerably larger than in the North Island. Canterbury had the largest average herd size in the South Island with 772 cows, 183 cows above the South Island average (589), while the average herd size in Otago-Southland was 538 cows.

There is a range of stocking rates nationwide, with Northland (2.3 cows/ha) and West Coast - Top of the South (2.1 cows/ha) having the lowest stocking rates. Canterbury had the highest stocking rate at 3.6 cows per hectare, while the remaining regions had average stocking rates between 2.6 and 3.1.

Bay of Plenty recorded the lowest average milksolids production per cow of all the regions (346 kg MS). The other four North Island regions recorded milksolids per cow between 380 and 416 kg MS. Canterbury recorded the highest milksolids sold per cow at 445 kg MS, and Otago-Southland recorded a milksolids sold per hectare of 431.

The average payout received in each region was at or above \$4.39 per kilogram of milksolids. Regional average farm working expenses (FWE) per kilogram of milksolids were lowest in Lower North Island (\$2.53), and the highest FWE per kilogram of milksolids was reported in Otago-Southland (\$3.12). The bottom of Table 10.1 shows the regional gross farm revenue, operating expenses and operating profit levels on a per hectare basis in 2021-22. Canterbury recorded the highest operating profit on a per hectare basis (\$2,217), while West Coast - Top of the South recorded the lowest operating profit per hectare, and was the only region to average below \$1,000/ha at \$975/ha. West Coast - Top of the South (\$3,889) and Northland (\$4,461) recorded the lowest gross farm revenue per hectare and the lowest operating expenses per hectare (\$3,162 and \$3,247, respectively). Canterbury recorded the highest gross farm revenue (\$7,989) and operating expenses (\$4,901) per hectare. In general, Sharemilkers in Canterbury and Lower North Island experienced higher levels of profitability in 2021-22 relative to other regions.

Table 10.2 shows the eight regions' key 2021-22 average financial indicators. The averages reported in this table are medians; see section 2.11 for an explanation of the *average of sums* methodology. Regional average operating returns on dairy assets ranged between 19.4 and 32.6 percent. Canterbury (32.6%) and Otago - Southland (30.6%) had the highest operating returns on dairy assets in 2021-22. West Coast - Top of the South had the lowest operating returns on dairy assets (19.4%). All regions reported positive returns on assets, with Canterbury (33.8%) and Otago - Southland (30.8%) recording the highest total returns on assets. Taranaki recorded the lowest total return on assets at 17.5 percent.

Total return on equity is the return on the owner's funds, including capital changes after interest is paid. All regions reported positive returns on equity, with Canterbury (52.9%) and Lower North Island (51.9%) recording the highest total return on equity. Taranaki (31.1%) recorded the lowest total return on equity.

Average term debt per kilogram of milksolids decreased nationally in 2021-22. There was variation between the regions, with Lower North Island (\$1.30) the lowest and Canterbury (\$2.53) the highest. The regional average debt to asset ratio ranged between 24.2 percent (Lower North Island) and 36.1 percent (Canterbury).

11 Dairy Tomorrow Measures

11.1 Annual Update

The Dairy Tomorrow Strategy outlines the aspirations that the New Zealand dairy sector wants to achieve to be competitive, productive, trusted, and valued. A core part of the Strategy is the development of an integrated set of measures for dairy farms. This report focuses on the four measures that together have been selected to help capture the international competitiveness and resilience of the New Zealand dairy sector from an economic perspective. These measures are:

- The cost of production, measured in terms of dollars per kilogram of milksolids, is a popular metric in global studies of competitiveness. In the New Zealand context, it is measured as operating expenses (\$) per kilogram of milksolids. A lower cost of production mitigates the impact of a low milk price on profitability and results in increased operating profit during high milk prices. It is a key measure of resilience as a low cost of production helps to buffer the impacts of a change in the milk price on a farm business.
- The dairy operating profit margin (%) is the ratio of operating profit and gross farm revenue. The dairy operating profit margin is a percentage most often between zero and fifty. A higher value denotes that a farm produces a given level of revenue at a lower cost, indicating that it is able to better survive through turbulent market and production conditions.
- The operating return on dairy assets, measured in percentage terms, is a key financial metric used worldwide to measure how effectively a business is employing their asset base. This metric captures the ability of a farm to grow through careful, considered investment in high-performing assets.
- The equity to milksolids metric, measured in dollars per kilogram of milksolids terms, reflects resilience through its focus on the value of the farm business asset that is owned and not borrowed. Controlling for the level of milk production makes it easier to compare across farms, both nationally and globally.

The Dairy Tomorrow measures are reported in Tables 11.1 through 11.4 by quartiles and the mean. The quartiles can be interpreted as follows:

- The 25th percentile for a variable represents a value where 25 percent of the data is lower.
- The 50th percentile or median represents the centre of the data, such that 50 percent of data points are lower, and 50 percent are higher than this value.
- The 75th percentile represents a value such that 75 percent of observations are lower than this value.

In comparison, the mean is an average calculated by adding all values together and dividing by the number of observations. The mean provides an average across the values for all observations.

Table 11.1: Cost of Production 2012-22
